

Problem Statement

A good gps doesn't exist, satellite imaging almost solves the issue but it is not fast/reliable enough to solve the problem.

Who is experiencing the problem?

Anybody who has to use a gps in unfamiliar areas.

What is the problem?

Many gps services are bad about giving false directions, or telling users to go on routes that are closed, or slow.

Where does the problem present itself?

The problem presents itself anytime you try to go somewhere without prior knowledge and have to use a gps.

Why does it matter?

In many cases this is infuriating and also in certain cases it is outright dangerous.
